Abstract

**Purpose:** The aim of the present study is to compare the visual acuity in different types of deviation.

**Methods:** A pilot, cross sectional, observational study was performed at tertiary eye care centers. Subjects with Ocular deviation between 10 to 40 prism diopeters, Corrected distance Visual Acuity should be greater than 6/18 and Age should be between 10 to 40 years of age were included in the study. Visual Acuity was assessed with Log Mar chart.

**Result:** 30 subjects were included in the study. Out of that, 16 subjects were in the age group of 11-20 years, 12 subjects were in the age group of 21-30 years and 2 subjects were in the age group of 31-40 years. 60% subjects were Female and 40% subjects were Male. The mean visual acuity was considered in each type of deviation. It shows that visual acuity will be deteriorated more in Esotropia as compared to Exotropia (Figures 1-3).

**Conclusion:** Deterioration of visual acuity is observed more in Esotropia as compared to Exotropia.

**Keywords:** Visual Acuity; Esotropia; Exotropia

Introduction

According to increasing ocular deviation Visual Acuity is being deteriorated due to the anatomical consideration is the main factor. Increasing ocular deviation proportionately image is shifted from the foveal region and thus deterioration is present. In case of Eso deviation images are shifted to nasal fovea and due to very less time of intermittent stages are present in Eso deviation there may be lots of chances to become Amblyopia compare to Exo deviation. If Eso deviation is present during the visual development stages on that time it become very crucial to treat it specially in case of Eso deviation due to most of the time deviated eye is become fixed but in case of Exo deviation most of the time it is associated with intermittent deviation. That's why there may be lots of chances of deterioration of visual acuity is more in Eso deviation compare to Exo deviation [1-5].

Methodology

A pilot, cross sectional, observational study was performed at tertiary eye care centers. Subjects with Ocular deviation between 10 to 40 prism diopeters, Corrected distance Visual Acuity should be greater than 6/18 and Age should be between 10 to 40 years of age were included in the study. Individuals with any other systemic disease (specially which can affect study), Individuals with any other Ocular Pathology, with any active ocular infection, any ocular anomalies like Corneal Scar etc, ocular deviation if less than 10 degree and Significant amount of amblyopic patient were excluded from the study. Full refractive correction along with detailed fundus evaluation was performed in each and every patient. Visual acuity was assessed with Log Mar chart in different types of ocular deviation. Data was analyzed using SPSS software version 20 [6].

Result

30 subjects were included in the study. Graph 1 shows distribution of subjects in various age groups. 16 subjects were in the age group of 11-20 years, 12 subjects were in the age group of 21-30 years and 2 subjects were in the age group of 31-40 years. Graph 2 shows gender wise distribution of the subjects. 60% subjects were Female and 40% subjects were Male. Graph 3 shows comparison of Visual Acuity for different types of ocular deviation. The mean visual acuity was considered in each type of deviation. It shows that visual acuity will be deteriorated more in esotropia as compared to exotropia (Figures 1-3).
Discussion

In case of ocular deviation images of an object are falling on parafoveal region and due to inequality of the number of the cone cells in the macular region there may be chances of the vision deterioration with increasing ocular deviation. In case of Esodeviation the images of an object is placed at the nasal retinal side and due to its intermittent stages is very low compare to Exodeviation, there have strong chances to become Amblyopia. Thus statistically it has been proved that with increasing ocular deviation visual Acuity has been deteriorated proportionately. According to the study it has been proved that in case of Esodeviation the deterioration of Visual Acuity is more compare to Exodeviation [7].

Conclusion

Deterioration of visual acuity is observed more in Esotropia as compared to Exotropia.
