**Introduction**

In this paper, we consider the famous double slit experience in light of AT Math. We see that familiar values for certain variables

reoccur. This model can be used on problems such as virus transmission. We begin with the familiar sine equals cosine (Figure 1).

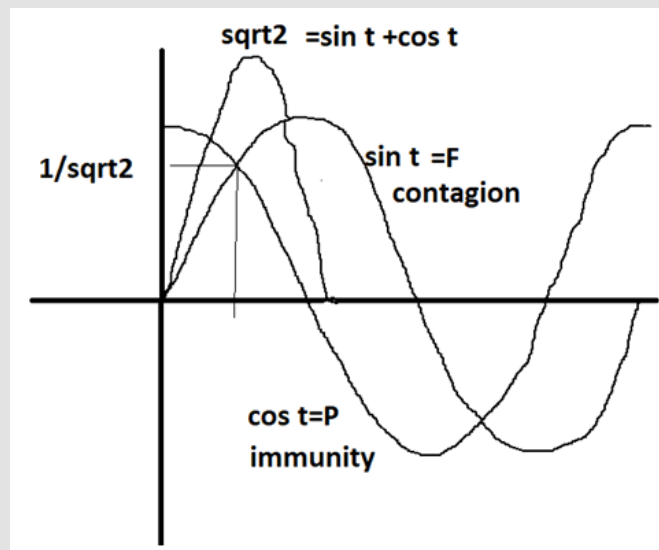

Figure 1: Immunity and Contagion.

Sine = cosine

Immunity =Contagion

$\cos \theta = \sin \theta$

$Mv=1/t$

$\ln t(1/\sqrt{2})=1/t$

$(1/\sqrt{2})\ln t=1/t$

$(1/\sqrt{2})y=y'$

$\sqrt{2}y=y'$

$\int \sqrt{2}y = \int y$

$(\sqrt{2})y^2/2=y$

$1/\sqrt{2} \times y=1$

$y=\sqrt{2}$

$\sin \theta + \cos \theta$

$=\sin 45 + \cos 45=$

$$= (1/\sqrt{2}) + (1/\sqrt{2})$$

$$= 2/\sqrt{2}$$

$$E = \sqrt{2} = \text{max of sin} + \text{cos} \quad (\text{Figure 2})$$

$$E = h\nu$$

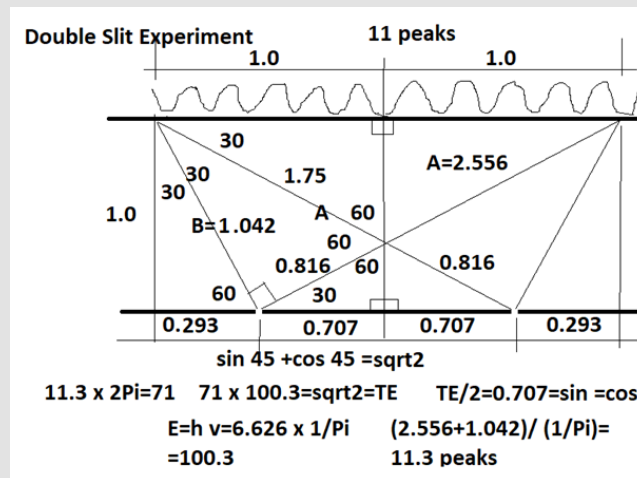

Figure 2: Double Slit Experiment.

$$= 6.626 \times 1/\pi$$

$$= 208.82$$

$$y = f(x) = 1/\sigma \sqrt{2\pi} \exp\left[-1/2(X - \mu)/\sigma\right]^2$$

$$\exp\left[-1/2(X - \mu)/\sigma\right]^2 = \exp\left[-1/2(0)/\sigma\right]^2 = \exp 0 = 1$$

$$y = f(x) = 1/\sigma \sqrt{2\pi} [1]$$

$$E = y = 2.08816 \sqrt{2\pi} = 1/\sigma$$

$$\sigma = .191$$

$$TE = 330 [1/2\pi] = 52.52$$

$$-1/2[X - \mu]/\sigma]^2 = 1$$

$$[(X - \mu)(0.191)]^2 = -2$$

$$(X - \mu)^2 = -0.7296$$

$$(X - 1/2)^2 = -0.73$$

$$X^2 - X + 1/4 = -0.73$$

$$X^2 - X - 1 = 0$$

**GMP**

$$V = iR$$

$$105i(1)$$

$$i = t^2$$

$$\sqrt{105} = t$$

$$t = 10.247$$

$$X^2 - X - 1 = 0$$

$$10247^2 - 10247 - 1 = 9397 \sim 940$$

$$f(x) = 1/(0.191) \sqrt{2\pi} \exp\left[(940 - 0.5)/0.191\right]^2$$

$$= [1/0.191 \sqrt{2}] \times (201.7)$$

$$= 0.7467 \sim 3/4 = 1/s$$

$$s = t$$

$$E = 3/4 = 1/s = 1/t \quad (\text{Figure 3})$$

$$\Delta L = d \sin \theta$$

**Entropy**

$$S = 1/2(Ln [2\pi e\sigma^2])$$

$$= -0.2366$$

$$t^2 - t - 1 = S = -0.2366$$

$$t^2 - t - 1.2366 = 0$$

$$t = 1.719 ; 0.719$$

$$E = 0.582 ; 1.39$$

$$M = Ln t$$

$$= Ln 1.719$$

$$= 542$$

$$M = Ln 0.719$$

$$= 330$$

$$TE = M [0.15915] = 542(1/2\pi) = 0.863 \sim 1/\sin 60^\circ$$

Figure 3: Double Split Experiment.

Note: <https://brilliant.org/wiki/double-slit-experiment/>

$$\Delta L = (1.042 - 2.556) = 1.514$$

$$1.514 = \sqrt{2} \sin \theta$$

$$\sin \theta = 1.514 / \sqrt{2}$$

$$= -1.07056$$

$$\theta = -0.618$$

$$d \sin \theta = n \lambda$$

$$(\sqrt{2})(-1.07056) = 11.3 \lambda$$

$$\lambda = 1.339 = 1/E = t$$

$$t^2 - t - 1 = E$$

$$E = 546$$

$$\text{GMP } E = -1.247$$

$$d\theta = y$$

$$y = \theta = -0.618$$

$$n \lambda = dy/D$$

$$11.3 \lambda = (1/\sqrt{2})(-1.0786) / (1)$$

$$\lambda = 1.047 \sim 105 = V+$$

$$\lambda = h/\bar{P}$$

$$104.7 = 6.626/\bar{P}$$

$$\bar{P} = 158 \sim \pi/2 = \cos \theta$$

$$\theta = 809 = 1/c^4$$

$$y = n \lambda D/d$$

$$1 = 11.3(\lambda)(1)/(\sqrt{2})$$

$$\lambda = 8$$

$$1/\lambda = 1.25 = E_{\text{min}}$$
